

Instructions for Texture Roller 920 Bark Roller

- Texture Roller 920 is a pattern roller that is intended to be used with Wel-Cote Custom or Sand Texture.
- It will create a texture similar to the bark found on trees.
- It is not a frame to hold other pattern rollers.

Use

The roller should be used after the surface has been properly prepared and coated with Wel-Cote Custom Texture at a thickness of 1/16" to 1/8".

The typical direction of the pattern is vertical from top to bottom. With the Wel-Cote Custom Texture moist, the roller should be placed at the starting point of the pattern and rolled to the ending point in a straight line. The resulting pattern will resemble the bark of a tree. Always use light pressure to roll the pattern. The material thickness will directly affect the depth of the pattern. Thinner material will result in a thinner, subtler pattern, while thicker material will result in a thicker, bolder pattern. You should periodically clean the roller with clean water during use to prevent build up of texture on the roller.

You can also run the pattern horizontally from side to side or roll the pattern in a non-linear pattern for some design variation. The only limit is your imagination. If you do not like the pattern, you can start over by simply misting the texture with water from a spray bottle and smooth it out with a moist paintbrush.
